At SEGES Innovation, we conduct research focused on delivering practical solutions to dairy farmers and processors, with a strong emphasis on milk quality. That's why we have launched the project "Targeted Bacterial Count Efforts", focusing on bacterial counts that can be directly linked to the cow. This is an area with limited scientific evidence, but one that is increasingly identified as a growing issue in our advisory work. The project is a collaboration between SEGES Innovation and Aarhus University and includes an integrated PhD project.

– Stay tuned – we provide solutions!
